Q.1 What is the purpose of using Anaconda for python development in machine learning.

→ Anaconda Simplifies python development for ML by building python with pre install data science libraries like Numpy, pandas, scikit learn, Plus the conda package manager for the dependency handling.

Q.2 What is the command to check if conda has been successfully installed on your PC?

→ Run `conda --version` or `conda info` in terminal / Anaconda Prompt.

Q.3 What are the steps to install python and the jupyter notebook using Anaconda.

→ Download and install the Anaconda from the official site, which includes python and Jupyter Note: no separate python install needed.

Q.4 What are the advantages of using google colab over Jupyter Notebook installed locally?

→ Google colab offers free GPU/TPU access, no local setup, easily sharing via google drive and pre installed ML libraries.

Q.5 How could you install the necessary libraries like Scikit-learn, Pandas and tensorflow?

→ Using command -
conda install scikit-learn
pandas tensorflow
conda automatically handles dependencies.

Q.6 What are key difference between Jupyter Notebook & Google Colab?

→ Jupyter runs locally, supports extensions.
Colab is browser based collaborative autosaves.

Q.7 How do you start a new jupyter notebook session?

f using
notebooks

20 / TPV
ly
pre

necessary
andas

ween
lab 3
rts

orative

yter

→ Open Anaconda Navigator and launch or run Jupyter Notebook. Click new and select python notebook.

Q.8 What are the key features of Tensorflow keras?

→ Tensorflow is an end-to-end ML platform for building / training models with GPU. keras is a high level API who integrated into Tensorflow for user friendly network
